samedi GmbH is a tech company located in the heart of Berlin with a Software as a Service (SaaS) solution for the health care sector, with a strong focus on information security (client-side encryption). samedi® supports the coordination between doctors, patients and insurance companies, and offers a wide range of possibilities to improve the collaboration of everyone involved in the health sector. This includes, for example, online case management and online appointment booking for patients. Our product is already being used by ten thousands of doctors and medical professionals for over seven million patients. Join us and be a part of a family-like (with kids and dogs ;-), creative and fun international team with an internationally awarded product (from LeWeb, Financial Times, German Government).

Senior System-Administrator (m/f)

We are looking to expand our team with an experienced **Senior System-Administrator** who will help us ensure that we meet our customers (hospitals, clinics, health insurance organizations) high availability and reliability demands. As an integral part of our development team, we will work together to improve all aspects of our SaaS platform: deployment processes, reliability, availability, performance, tooling, developer/team happiness, and security (due to the nature of our business we take security very seriously, ensuring that all sensitive information is never leaving the client-side unencrypted).

Your Day-to-Day Work:
- Ensuring that our infrastructure and services are up and running
- Improve our high-availability setup so that nothing we can foresee can take us down (no single points of failure)
- When something that we didn't foresee takes us down, respond fast and address it in a way that will prevent it from happening again. Each failure should make us stronger :-)
- Perfect our monitoring so that we are the first to know if anything goes wrong
- Test our high availability in a controlled environment and mock emergency situations so that we are prepared for real incidents
- Make the whole development team happier by working together on better tooling, improved performance, metrics visibility and insights, etc.

Your Profile:
- Significant experience on managing Linux systems (we use Ubuntu on bare metal servers)
- Infrastructure as a code (we are using chef)
- Experience with deploying and monitoring large scale web applications (we use Ruby on Rails and PostgreSQL mainly, but here and there you can find Go, Redis, Elasticsearch, NodeJS, and others)
- Feel confident that our services will be available and operational under foreseeable conditions, so you don't need to worry during night or your vacations

  It's definitely OK if you haven't worked with every single technology we use, as long as you are willing to learn and grow with us. One thing we really care about is that you are empathetic, willing to share, teach, and learn from your colleagues, and open to new opinions and perspectives.

The Team:
- We are a small but very diverse team. We are not looking to expand or hire aggressively as we prefer to give new employees the time to become an organic part of our team
- A familiar corporate atmosphere with team-events, shared Monday breakfasts, table football etc.

If you think you are the right person for this job and fulfill the requirements, we are looking forward to your application. Please specify the first possible date of availability as well as your salary expectations.
